1. The following information is provided for the purpose of identifying the invention and is not to be construed as a limitation on the scope of the invention. The invention is a method for determining the relative amounts of the components of a mixture. The method involves the use of a computer to analyze the data obtained from a gas chromatograph. The data is then compared to a library of known compounds to identify the components. The relative amounts of the components are then determined by comparing the peak areas of the components to the peak areas of the known compounds. The method is described in detail in the following paragraphs.
